Magnets floating or captive!

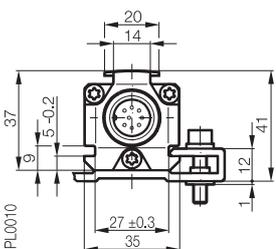

Balluff Micropulse transducers in the Profile housing, with their mechanical design, the high protection rating, and their ease of installation, are an alternative to linear transducers such as potentiometers, glass scales, and LVDTs. The linear sensing element is protected in an aluminum extrusion. The measuring point along the sensing element (waveguide) is indicated by a passive marker (magnet), which needs no power. Measuring stroke ranges between 50 and 5000 mm are available.

- non-contact detection of the actual position
- IP 67, insensitive to contamination
- wear-free
- insensitive to shock and vibration
- absolute output signal
- resolution up to 0.0004" (0.001 mm) (depending on processor used)
- direct signal processing or through processor cards for interfacing with any control system or stand-alone operation

Series	BTL5 Profile

The analog outputs of the profile series are potential-free with respect to the input voltage. The isolation is galvanic using DC/DC converters.

Analog type BTL transducers are available in various output configurations: 0...10 V, 4...20 mA, 0...20 mA and -10...10 V, with rising and falling output slope.

P Interface

Compatible with BTA/BTM processors and various OEM controls, e.g. Siemens, B & R, Phoenix Contact, Mitsubishi, Sigmatek, Parker, Esitron, WAGO etc.. Reliable signal transmission, even over cable lengths up to 500 m between BTA and BTL, is assured by the especially noise-immune RS485 differential drivers and receivers. Noise signals are effectively suppressed.

M Interface

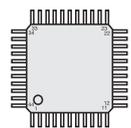

The I and M interfaces are control-specific interface variations.

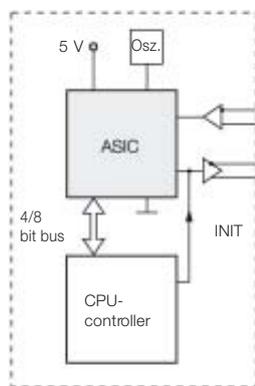

Block diagram of P-interface

Highly precise digitizing of the P-interface signal

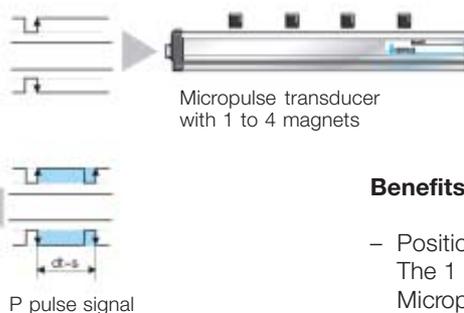

Companies developing their own control and processing electronics can create a highly accurate P-interface cost effectively and with a minimum of effort using the Balluff digitizing chip. The digitizing chip was developed as a high-resolution, configurable ASIC for the Micropulse P-interface.

Digitizing chip 44QFP

Controller or Processing electronics

Benefits

- Position resolution 1 μm! The 1 μm resolution of the Micropulse positioning system is achieved by the high resolution of the digitizing chip (133 pS). (Clock frequency 2 or 20 MHz)
- Position data from 4 magnets can be processed simultaneously
- 4/8-bit processor interface

Standard SSI interface

Synchronous serial data transmission for controls made by Siemens, Bosch-Rexroth, WAGO, B & R, Parker, Esitron, PEP etc. as well as for Balluff BDD-AM 10-1-SSD and BDD-CC 08-1-SSD display/controllers.

Reliable signal transmission, even over cable lengths of up to 400 m between control and BTL transducer is assured by especially noise-immune RS485/422 differential line drivers and receivers. Any noise signals are effectively suppressed.

BTL5-S1... with processor/controller, wiring example

Synchronized SSI interface

BTL5-S1__B-M____P-____

Micropulse transducers with the synchronized SSI interface are suitable for dynamic control applications. The data acquisition in the transducer is synchronized to the external clock of the controller, permitting an optimum velocity calculation in the controller. The pre-requirement for this synchronous mode of transducer operation is consistent clock signal timing.

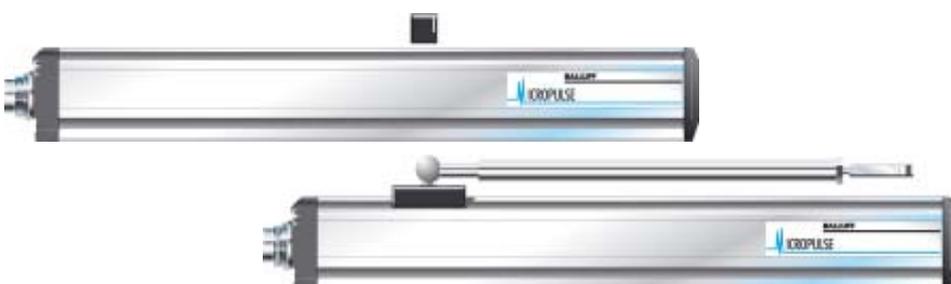

The **maximum sampling frequency f_A** , at which a new current value is generated for each sample, can be derived from the following table:

mm	mm	Hz
nominal stroke \leq 120 : 2500		
120 < nominal stroke \leq 475 : 2000		
475 < nominal stroke \leq 750 : 1500		
750 < nominal stroke \leq 1250 : 1000		
1250 < nominal stroke \leq 2600 : 500		
2600 < nominal stroke \leq 4000 : 333		

Clock frequency is a function of cable length

Cable length	Clock freq.
< 25 m	< 1000 kHz
< 50 m	< 500 kHz
< 100 m	< 400 kHz
< 200 m	< 200 kHz
< 400 m	< 100 kHz

Super-fast 2.5 kHz Sampling rate

User-friendly hardware and software set-up

CANopen interface

Based on CAN (ISO/IEC 7498 and DIN ISO 11898), CANopen provides a Layer-7 implementation for industrial CAN networks. The serial data protocol of the CAN specification is defined according to the producer-consumer principle as opposed to most other fieldbus protocols. This eliminates target addressing of the process data. Each bus station decides for itself how the received data are processed.

The CANopen interface of the Micropulse transducer is compatible with CANopen conforming with CiA Standard DS301 Rev. 3.0, and with CAL and Layer 2 CAN networks.

CAN-BUS features

- Line topology, star structure also possible using repeaters
- Cost-effective 2-wire cabling
- Fast response times, high data integrity using CRC, hamming distance of 6
- 1 Mbps at cable lengths < 25 m
- Number of stations protocol-limited to 127
- Using multiple magnets: A minimum spacing of > 65 mm must be maintained.

CANopen offers a high level of flexibility with respect to functionality and data exchange. Using a standard data sheet in the form of an EDS file it is easy to link the Micropulse transducers to any CANopen system.

Process Data Object (PDO)

12 Micropulse transducers send their position information optionally in one or two PDOs with 8 bytes of data each. The contents of the PDOs is free configurable. The following information can be sent:

- Current magnet position with resolution in 5 μ m steps
- Current velocity of the magnet with resolution selectable in 0.1mm/s steps
- Current status of the four freely programmable cams per magnet.

Synchronization Object (SYNC)

Serves as a net-wide trigger for synchronizing all network participants. When the SYNC object is received, all Micropulse transducers active on the bus store their current position and velocity information and then send it sequentially to the control. This assures time-synchronous capture of the measured values.

LED

Display of the CANopen status to DS303-3

FMM

The sensor can be operated as a 4-magnet type, whereby the sensor itself recognizes how many magnets are currently active. So if only two magnets are positioned in the measurement range, a valid value is output for the first two positions and a defined error value for positions 3 and 4.

Emergency Object

This object is sent with the highest priority. This is used for example for error messages when cam states change.

Service Data Object (SDO)

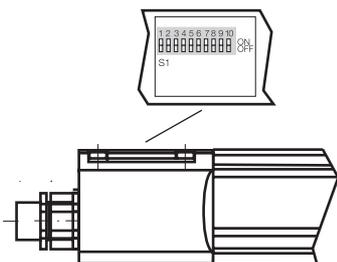

Service Data Objects transmit the parameters for the transducer configuration. The transducer configuration may be carried out on the bus by the controller, or offline using a PC with a configuration tool which runs under Windows. The configuration is stored in the transducer in a non-volatile memory.

CiA 199911-301v30/11-009

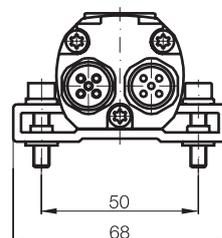

Use of multiple magnets

A minimum spacing of > 65 mm must be maintained.

DeviceNet

DeviceNet is an open standard field bus, manufacturer-independent, in which automation technology for connecting programmable logic devices (PLCs) to intelligent devices such as sensors, pushbuttons, I/O modules, basic user interfaces and drives using a single cable. DeviceNet is an application protocol (OSI layer 7) based on the Controller Area Network (CAN) principle. It offers high reliability for demanding applications with a high number of I/O modules. The transmission speed depending on type and length of the cable is from 125 kBit/s to 500 kBit/s.

Master

DeviceNet is multi-master capable, i.e. several DeviceNet devices can simultaneously request the current position. The data transfer is controlled by the priority of the message. Messages on the DeviceNet carry an identifier.

The message that was sent can be received by all devices simultaneously (broadcast). Message filtering is performed by the device only for messages intended for it. The criterion for this decision is the identifier, with which each message is transmitted.

EDS

DeviceNet offers parameterization of functionality and data exchange. Using a standard data sheet in the form of an EDS file it is easy to link the Micropulse transducers to any DeviceNet system.

DeviceNet features

- Linear topology
- Cost-effective wiring with two-wire cable
- Fast response times,
- High data security due to CRC checking,

- Hamming distance of 6
- Potential-free data transmission (RS485)
- 125 Kb/s at cable length < 500 m
- 250 Kb/s at cable length < 250 m
- 500 Kb/s at cable length < 100 m
- Number of stations protocol-limited to 64

Position Sensor Object

The DeviceNet interface of the Micropulse transducer is compatible with the CIP Common Specification Object Library "Position Sensor Object" of the ODVA.

The Micropulse transducers transmit their measurement values in an entity of the Position Sensor Objects as a 32-bit value.

The following information can be sent:

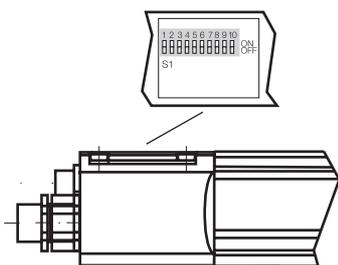

- Current magnet position with resolution in 5000 µm steps
- Current magnet velocity in nm/s steps
- Current status of the four freely programmable cams.

Synchronization

Measurement can be triggered by the master I/O bit Strobe Command Message. Each network node is assigned a bit within this message. On receiving this bit the respective Micropulse transducer saves its instantaneous position and velocity information, which then be interrogated by the controller.

FMM

The sensor can be operated as a 4-magnet type, whereby the sensor itself recognizes how many magnets are currently active. So if only two magnets are positioned in the measurement range, a valid value is output for the first two positions and a defined error value for positions 3 and 4.

Position of the DIP switch S1,

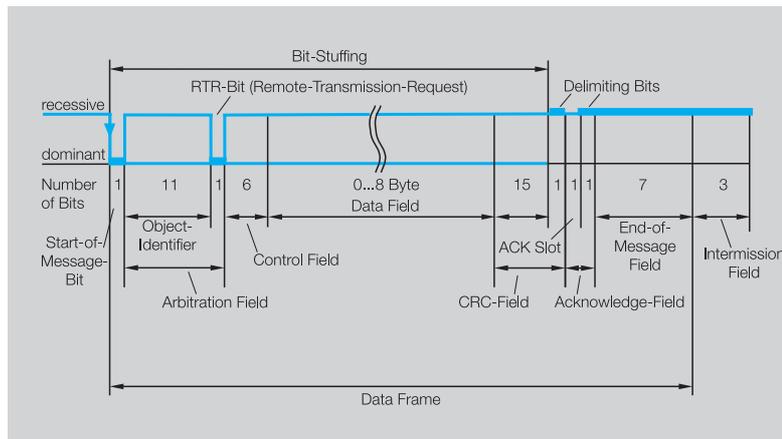

Device address can be set by DIP switch

Use of multiple magnets

A minimum spacing of > 65 mm must be maintained.

User-friendly hardware and software set-up

As the market leading standard for serial data transmission for process automation, PROFIBUS-DP is the ideal choice for implementing automation tasks with cycle times of > 5 ms.

Data transmission

A PROFIBUS telegram can contain up to 244 bytes of user data per telegram and station. The BTL5-T uses max. 32 bytes (max. 4 position values and max. 4 velocity values) for process data transmission. Up to 126 active stations (Address 0...125) can be connected on PROFIBUS-DP. User data cannot be sent with station address 126. This address is used as the default address for bus stations that have to be parameterized by a Class 2 master (for setting the device address if there are no mechanical switches available). Each PROFIBUS station has the same priority. Prioritizing of individual stations is not intended, but can be done by the master since the bus transmission only makes up a fraction of the process cycle anyway. At a transmission rate of 12 Mbps, the transmission time for an average data telegram is in the 100 µs range.

Master

There are two types of possible masters for PROFIBUS-DP. Master Class 1 carries out the user data interchange with the connected slaves. Master Class 2 is intended for startup and diagnostic purposes and may be used to briefly assume control of a slave.

GSD (Device Master Data)

The length of the data exchangeable with a slave is defined in the Device Master Data file (GSD) and is checked by the slave with the configuration telegram and confirmed for correctness. In modular systems, various configurations are defined in the GSD file. Depending on the desired functionality, one of these configurations can be selected by the user when the system is configured. The BTL5-T is a modular device with the possibility of selecting the number of magnets (position values).

Slave

Once a PROFIBUS master has received the parameter set defined for the slave, it is able to exchange data. The parameter set consists of slave parameters and configuration data. The parameter data contain the description of the slave settings (e.g. resolution of a position value). The configuration data describe the length and structure of the data telegram.

Process data

Under PROFIBUS-DP the default is for process data to be sent from the master to slaves acyclically and for the slave data to then be queried. To ensure synchronization of multiple devices, the master may use the SYNC and FREEZE services.

DP/V1 and DP/V2

Isochronic mode

Isochronic mode enables quick and deterministic data exchange by means of clock synchronicity on the bus system. A cyclic equidistant clock signal is sent by the master to all bus devices. This signal allows master and slaves to be synchronized irrespective of application – with an accuracy < 1 µs.

Cross traffic between slaves

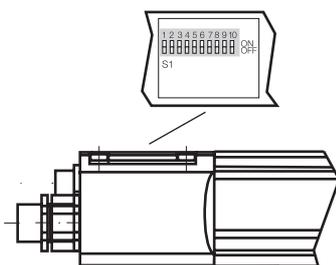

Cross traffic permits two DP slaves to exchange data directly with each other: the master ensures that the slave publishes its data on the bus with a request for "Data-eXchange-Broadcast" (DXB-Request) and thus makes it available to other slaves. Since the process data is available in the process periphery without being diverted through the master application, cross-traffic permits very fast control system responses.

Acyclic services

The DP functions for prioritized communication permit acyclic read and write functions to be sent between master and slaves, independently of the cyclic user data traffic. The transfer of acyclic data is performed at a lower priority in parallel to the high speed cyclic data exchange – as if in the background. The background / foreground split means the ratio of cyclic to acyclic data can be adjusted if required.

FMM

The sensor can be operated as a 4-magnet type, whereby the sensor itself recognizes how many magnets are currently active. So if only two magnets are positioned in the measurement range, a valid value is output for the first two positions and a defined error value for positions 3 and 4.

Balluff magnets are available in captive or floating styles. All BTL5 magnets shown here can be used on any Balluff Micropulse transducer. Maximum resolution and repeatability are achieved using captive magnets BTL5-F/M/N-2814-1S.

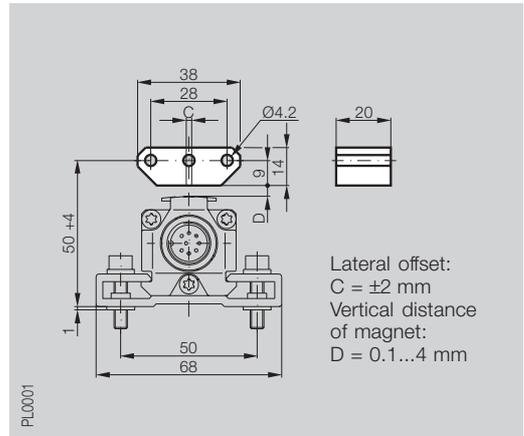

The BTL5-P-3800-2 magnet can be used with a vertical offset from the upper surface of the transducer body of 0.1...4 mm, and the BTL5-P-5500-2 permits a distance of 5...15 mm. The BTL5-P-4500-1 is an electromagnet and requires a supply voltage of 24V, which can be turned on and off for selective activation. This allows multiplex operation with multiple magnets on a single transducer, since only one magnet is active at a time.
