# Legal information

# Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

# **▲** DANGER

indicates that death or severe personal injury will result if proper precautions are not taken.

# **M**WARNING

indicates that death or severe personal injury may result if proper precautions are not taken.

# **A** CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

### NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### **Qualified Personnel**

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

# **▲** WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

# Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Introduction

# 1.1 Purpose of this documentation

These instructions contains all information that you will require to replace the connection board, pushbutton module, display, application electronics, and measuring cell of the device.

For information about the safe usage of the device, refer to the detailed version of these instructions and corresponding safety instructions on the electronic data medium.

Read these instructions carefully before you start any service and maintenance work. In order to use the device correctly, first make yourself acquainted with its principle of operation.

Readership of these instructions are service and maintenance technicians.

# 1.2 Product information

The programming manual is an integral part of the CD, which is either supplied or can be ordered. The programming manual is also available on the Siemens homepage.

On the CD, you will also find the catalog extract with the ordering data, the Software Device Install for SIMATIC PDM for additional installation, and the required software.

1.3 History

# 1.3 History

This history establishes the correlation between the current documentation and the valid firmware of the device.

The documentation for this revision is applicable for the following firmware:

Version	Firmware and hardware identity nameplate	System integration	Installation path for PDM	Note
02 09/201 0	FW: 35.01.00 HW: 11.01.01	PDM 6.0 <sup>1)</sup> ; Dev. R.3 DD; 01.00.00 Rev.1	SITRANSP500	
03 04/201 3	FW: 35.02.00 HW: 11.01.01	PDM 6.01); Dev. R.3 DD; 01.00.00 Rev.1	SITRANSP500	

<sup>1)</sup> to SP05

# 1.4 Purpose

### Overview

Depending on the variant, the pressure transmitter measures corrosive, non-corrosive and hazardous gases, vapors and liquids.

With appropriate configuration, you can also use the differential pressure transmitter for the following measurement types:

- Level
- Volume
- Mass
- Volume flow
- · Mass flow rate

The output signal is always a load-independent direct current between 4 and 20 mA upon which a HART protocol is superimposed.

You can install the "Intrinsically safe" or "Flameproof enclosure" version of the transmitter in hazardous areas. The devices have an EC type-examination certificate and meet the regulations applicable to them, for example, the harmonized CENELEC standards in Europe.

Transmitters with remote seals of different shapes can be delivered for special applications. For example, measuring high-viscosity substances is a special application.

Operate the device in accordance with the specifications in section Auto-Hotspot.

For additional information, please refer to the operating instructions for the device.

# 1.5 Checking the consignment

- 1. Check the packaging and the device for visible damage caused by inappropriate handling during shipping.
- 2. Report any claims for damages immediately to the shipping company.
- 3. Retain damaged parts for clarification.
- 4. Check the scope of delivery by comparing your order to the shipping documents for correctness and completeness.

Using a damaged or incomplete device

Danger of explosion in hazardous areas.

· Do not use damaged or incomplete devices.

# 1.6 Notes on warranty

The contents of this manual shall not become part of or modify any prior or existing agreement, commitment or legal relationship. The sales contract contains all obligations on the part of Siemens AG as well as the complete and solely applicable warranty conditions. Any statements regarding device versions described in the manual do not create new warranties or modify the existing warranty.

The content reflects the technical status at the time of publishing. Siemens reserves the right to make technical changes in the course of further development.

1.6 Notes on warranty

Safety information 2

# 2.1 Precondition for use

This device left the factory in good working condition. In order to maintain this status and to ensure safe operation of the device, observe these instructions and all the specifications relevant to safety.

Observe the information and symbols on the device. Do not remove any information or symbols from the device. Always keep the information and symbols in a completely legible state.

Symbol	Explanation
M	Consult operating instructions

### 2.1.1 Laws and directives

Observe the test certification, provisions and laws applicable in your country during connection, assembly and operation. These include, for example:

- National Electrical Code (NEC NFPA 70) (USA)
- Canadian Electrical Code (CEC) (Canada)

Further provisions for hazardous area applications are for example:

- IEC 60079-14 (international)
- EN 60079-14 (EC)

# 2.1.2 Conformity with European directives

The CE mark on the device is a sign of conformity with the following European directives:

Electromagnetic Directive of the European Parliament and of the Council on the Compatibility EMC approximation of the laws of the Member States relating to electromagnetic compatibility and repealing Directive

89/336/EEC.

Atmosphère explosible Directive of the European Parliament and the Council on the

ATEX approximation of a squipment and pr

approximation of the laws of the Member States concerning equipment and protective systems intended for use in

potentially explosive atmospheres.

Pressure Equipment Directive PED 97/23/EC Directive of the European Parliament and of the Council on the approximation of the laws of the Member States concerning

pressure equipment.

The standards applied can be found in the EC declaration of conformity for the device.

# 2.2 Improper device modifications

### **WARNING**

### Improper device modifications

Danger to personnel, system and environment can result from modifications to the device, particularly in hazardous areas.

Only carry out modifications that are described in the instructions for the device. Failure
to observe this requirement cancels the manufacturer's warranty and the product
approvals.

# 2.3 Requirements for special applications

Due to the large number of possible applications, each detail of the described device versions for each possible scenario during commissioning, operation, maintenance or operation in systems cannot be considered in the instructions. If you need additional information not covered by these instructions, contact your local Siemens office or company representative.

### Note

### Operation under special ambient conditions

We highly recommend that you contact your Siemens representative or our application department before you operate the device under special ambient conditions as can be encountered in nuclear power plants or when the device is used for research and development purposes.

# 2.4 Use in hazardous areas

# Qualified personnel for hazardous area applications

Persons who install, assemble, commission, operate and service the device in a hazardous area must have the following specific qualifications:

- They are authorized, trained or instructed in operating and maintaining devices and systems according to the safety regulations for electrical circuits, high pressures, aggressive and hazardous media.
- They are authorized, trained, or instructed in carrying out work on electrical circuits for hazardous systems.
- They are trained or instructed in maintenance and use of appropriate safety equipment according to the pertinent safety regulations.

### Unsuitable device for the hazardous area

Danger of explosion.

 Only use equipment that is approved for use in the intended hazardous area and labelled accordingly.

# **A** WARNING

# Loss of the safety of the device with type of protection "Intrinsic safety Ex i"

If the device has already been operated in non-intrinsically safe circuits or the information on the electrical specifications have been ignored, the safety of the device is no longer ensured for use in hazardous areas. There is a danger of explosion.

- Connect the device in Intrinsic Safety type of protection solely to an intrinsically safe circuit.
- Observe the information on the electrical specifications in the certificate and in the technical data.

# **A**WARNING

# Use of incorrect device parts in potentially explosive environments

Devices and their associated device parts are either approved for different types of protection or they do not have explosion protection. There is a danger of explosion if device parts (such as covers) are used for devices with explosion protection that are not expressly suited for this type of protection. If you do not adhere to these guidelines, the test certificates and the manufacturer warranty will become null and void.

- Use only device parts that have been approved for the respective type of protection in the potentially explosive environment. Covers that are not suited for the "explosionproof" type of protection are identified as such by a notice label attached to the inside of the cover with "Not Ex d Not SIL".
- Do not swap device parts unless the manufacturer specifically ensures compatibility of these parts.

# **A** WARNING

# Risk of explosion due to electrostatic charge

To prevent the build-up of an electrostatic charge in a hazardous area, the key cover must be closed during operation and the screws tightened.

The key cover may be opened temporarily at any time for the purposes of operating the transmitter, even during plant operation; the screws should then be tightened again.

### NOTICE

### Electrostatic-sensitive devices

The device contains electrostatic-sensitive devices (ESD). ESD can be destroyed by voltages far too low to be detected by humans. These voltages can occur if you simply touch a component part or the electrical connections of a module without being electrostatically discharged. The damage to a module caused by overvoltage cannot normally be detected immediately; it only becomes apparent after a longer period of operating time has elapsed.

Protective measures against the discharge of static electricity:

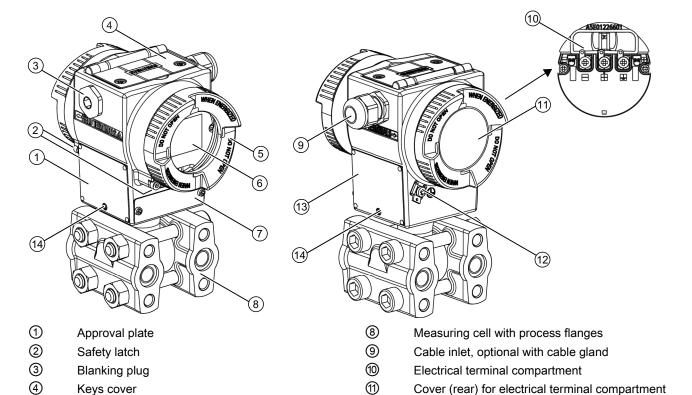

- Make sure that no power is applied.
- Before working with modules, make sure that you discharge static from your body, for example by touching a grounded object.
- · Devices and tools used must be free of static charge.
- · Hold modules only by their edges.
- · Do not touch connector pins or conductor tracks on a module with the ESD notice.

2.4 Use in hazardous areas

Description

# 3.1 Structure

Depending on a customer-specific order, the device comprises different parts.

Device view of the transmitter

Measuring point label

Display (optional)

Cover (front), optionally with an inspection window

- The electronic enclosure is made of aluminum die casting.
- The enclosure has a removable circular cover at the front and the back.

12

(13)

(14)

Protective conductor connection

Retaining screws (both sides), twist proofing of the measuring cell in relation to the electronics

Nameplate

enclosure

- Depending on the device version, the cover ⑤ is provided with an inspection window.
   Through the inspection window, the measured values can be read from the display (optional) ⑥.
- The user must not use the service connector located behind the display ⑥. The service plug is for the exclusive use of the manufacturer.

(5)

6

(7)

Figure 3-1

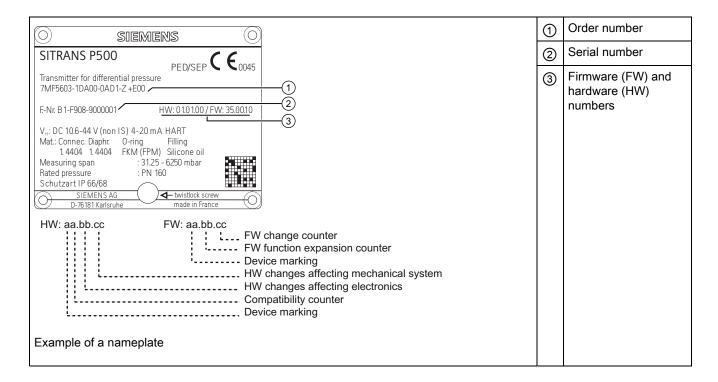

### 3.2 Nameplate layout

- The cable inlet (9) to the electrical terminal compartment on the left or right side can be used selectively. The corresponding unused opening is closed with a blanking plug (3).
- The protective conductor terminal ② is located on the rear of the housing.
- The electrical terminal compartment (10) for power supply and shield is accessible when you unscrew the cover (11).
- Underneath the electronics housing is the measuring cell with its pressure caps on which
  the process connections ® are located. The modular structure of the pressure
  transmitter allows you to replace the measuring cell, application electronics, connection
  board, pushbutton module, and the optional display when required.
- On the upper face of the enclosure you can see crosshead screws which secure the cover ④, under which the 3 keys for local operation are located.

# 3.2 Nameplate layout

# Nameplate with general information

The nameplate with the order number and other important data, such as the design details and technical data can be found on the side of the enclosure.

# Nameplate with approval information

The nameplate with approval information is on the opposite side. For the Ex-version of the transmitter, the information on the respective certificate is also listed.

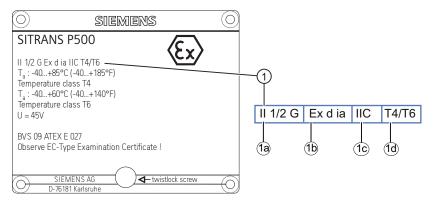

Figure 3-2 Example of a nameplate

- ① Characteristics of the hazardous area
- (1)a Category of the operating range
- 1b Type of protection
- ①c Group (gas, dust)
- 1)d Maximum surface temperature (temperature class)

Service and maintenance

# 4.1 Basic safety instructions

# Impermissible repair of explosion protected devices

Danger of explosion in areas subject to explosion hazard.

Repair must be carried out by Siemens authorized personnel only.

# Impermissible accessories and spare parts

Danger of explosion in areas subject to explosion hazard.

- Only use original accessories or original spare parts.
- Observe all relevant installation and safety instructions described in the instructions for the device or enclosed with the accessory or spare part.

# **WARNING**

# Use of incorrect device parts in potentially explosive environments

Devices and their associated device parts are either approved for different types of protection or they do not have explosion protection. There is a danger of explosion if device parts (such as covers) are used for devices with explosion protection that are not expressly suited for this type of protection. If you do not adhere to these guidelines, the test certificates and the manufacturer warranty will become null and void.

- Use only device parts that have been approved for the respective type of protection in the potentially explosive environment. Covers that are not suited for the "explosionproof" type of protection are identified as such by a notice label attached to the inside of the cover with "Not Ex d Not SIL".
- Do not swap device parts unless the manufacturer specifically ensures compatibility of these parts.

# 4.1 Basic safety instructions

# Maintenance during continued operation in a hazardous area

There is a danger of explosion when carrying out repairs and maintenance on the device in a hazardous area.

- Isolate the device from power.
- or -
- Ensure that the atmosphere is explosion-free (hot work permit).

# Commissioning and operation with pending error

If an error message appears, correct operation in the process is no longer guaranteed.

- · Check the gravity of the error
- · Correct the error
- If the error still exists:
  - Take the device out of operation.
  - Prevent renewed commissioning.

# Hot, toxic or corrosive process media

Danger of injury during maintenance work.

When working on the process connection, hot, toxic or corrosive process media could be released.

- As long as the device is under pressure, do not loosen process connections and do not remove any parts that are pressurized.
- Before opening or removing the device ensure that process media cannot be released.

### Improper connection after maintenance

Danger of explosion in areas subject to explosion hazard or device damage.

- · Connect the device correctly after maintenance.
- Close the device after maintenance work.

See Operating Instructions.

# **WARNING**

### Use of a computer in a hazardous area

If the interface to the computer is used in the hazardous area, there is a danger of explosion.

· Ensure that the atmosphere is explosion-free (hot work permit).

### Releasing key lock

Improper modification of parameters could influence process safety.

 Make sure that only authorized personnel may cancel the key locking of devices for safety-related applications.

### Hot surfaces

Danger of burns during maintenance work on parts having surface temperatures exceeding 70 °C (158 °F).

- Take corresponding protective measures, for example by wearing protective gloves.
- After carrying out maintenance, remount touch protection measures.

### NOTICE

### Electrostatic-sensitive devices

The device contains electrostatic-sensitive devices (ESD). ESD can be destroyed by voltages far too low to be detected by humans. These voltages can occur if you simply touch a component part or the electrical connections of a module without being electrostatically discharged. The damage to a module caused by overvoltage cannot normally be detected immediately; it only becomes apparent after a longer period of operating time has elapsed.

Protective measures against the discharge of static electricity:

- Make sure that no power is applied.
- Before working with modules, make sure that you discharge static from your body, for example by touching a grounded object.
- Devices and tools used must be free of static charge.
- · Hold modules only by their edges.
- Do not touch connector pins or conductor tracks on a module with the ESD notice.

# 4.2 Maintenance and repair work

# 4.2 Maintenance and repair work

# 4.2.1 Defining the maintenance interval

### No maintenance interval has been defined

Device failure, device damage, and risk of injury.

- Define a maintenance interval for regular tests in line with device use and empirical values.
- The maintenance interval will vary from site to site depending on corrosion resistance.

# 4.2.2 Checking the gaskets

### Note

# Checking the gaskets

At regular intervals, check that the enclosure seals of the pressure transmitter satisfy IP66 / IP68. Grease or replace the gaskets if required.

# 4.2.3 Changing the measuring cell and application electronics

### Related

Each of the individual components "Measuring cell" and "Electronics" has a non-volatile memory (EEPROM).

Measuring cell data (e.g.: measuring range, measuring cell material, oil filling) and application-specific electronics data (e.g.: downscaling, additional electrical damping) are located in the measuring cell EEPROM. Application-specific data are lost when the measuring cell is changed. Application-specific data are not lost when the application electronics are changed.

You can backup application-specific data before changing the measuring cell and reload them afterwards. Use an input device which supports the HART protocol. (e.g. HART communicator, PC with HART modem and HART software or PC with HART modem and PDM software). Factory settings will be used if application-specific data are not backed up before the measuring cell is changed.

Technical developments enable advanced functions to be implemented in the firmware of the measuring cell or application electronics. Further technical developments are indicated by modified firmware statuses (FW). The firmware status does not affect whether the modules can be replaced. However, the scope of functions is limited to the function of existing components.

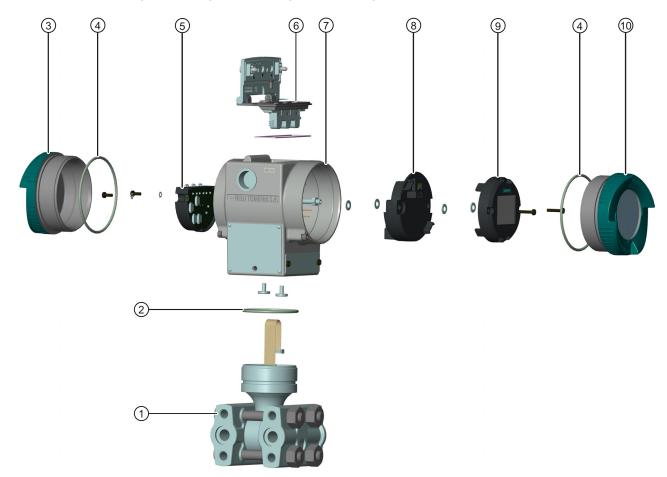

If a combination of certain firmware versions of measuring cell and application electronics is not possible for technical reasons, the device will identify this problem and go into "Fault current" mode. This information is provided via the HART interface.

# 4.2 Maintenance and repair work

# 4.2.4 Replacing parts

# 4.2.4.1 Exploded view of the device

The device consists of different components, depending on the customer's order. The next chapters show you how to replace the components.

- Measuring cell with process flanges
- Sealing ring between the measuring cell and housing
- 3 Cover (rear) for electronic terminal compartment
- 4 Sealing ring between the cover and housing
- ⑤ Connection board

Figure 4-1 Exploded view of the transmitter

- 6 Pushbutton module
- 7 Housing
- 8 Application electronics
- 9 Display (optional)
- (1) Cover (front), optionally with inspection window

# 4.2.4.2 Replacing the connection board

# Procedure for replacing the connection board

- 1. Isolate the device from power.
- 2. Open the cover of the electronic connection compartment.

3. Disconnect the cables from the connection board.

# 4.2 Maintenance and repair work

4. On the left and right side, remove the recessed-head screws that hold the connection board to the enclosure.

5. Remove the connection board.

# To install the connection board, proceed as follows

1. Insert the new connection board so that its contact pins on rear side mate the contacts in the housing.

2. Work in the reverse order as described in "Procedure for replacing the connection board".

# See also

Structure (Page 15)

Exploded view of the device (Page 24)

# 4.2.4.3 Replacing the pushbutton module

# **Procedure**

- 1. Isolate the device from power.
- 2. To open the pushbutton cover, remove both recessed-head screws from the outside of the cover.

# 4.2 Maintenance and repair work

3. Using a TX9 torx screwdriver, remove the three screws you can now see.

4. Remove the pushbutton module from the housing.

- 5. To install the new pushbutton module, carry out the same steps in the reverse order.
- 6. When inserting the new pushbutton module, make sure that the seals are sitting properly.

# See also

Structure (Page 15)

Exploded view of the device (Page 24)

# 4.2.4.4 Replacing the display

# Procedure for replacing the display

1. Open the front cover (optional with inspection window).

2. Remove the recessed-head screws on the left and right side.

3. Pull the display out of the housing.

# 4.2 Maintenance and repair work

# Procedure for installing the display

- 1. Insert the new display so that the the contact pins on its rear side mate the socket strip.
- 2. You can also turn the mounting position of the display by 90  $^{\circ}$ , 180  $^{\circ}$ , or 270  $^{\circ}$ .
- 3. Work in the reverse order as described in "Procedure for replacing the display".

# See also

Structure (Page 15)

Exploded view of the device (Page 24)

# 4.2.4.5 Replacing the application electronics

# Procedure for replacing the application electronics

- 1. Isolate the device from power.
- 2. Open the front cover of the display (optional with inspection window).
- 3. Remove the display. See Section Replacing the display (Page 28).
- 4. Using an 8 mm socket wrench, remove the hexagon nuts from the left and right side.

5. Remove the application electronics.

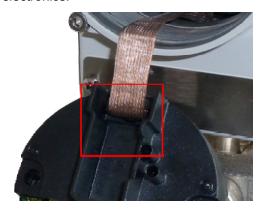

6. Disconnect the ribbon cable from the application electronics.

# Procedure for installing the application electronics

- 1. Connect the ribbon cable to the application electronics so that the coding notch of the connector faces upward. Compare the corresponding marking on the application electronics with the photo image.
- 2. Do not kink, pinch, or twist the ribbon cable when plugging it onto the application electronics.

3. Work in the reverse order as described in "Procedure for replacing the application electronics".

# 4.2 Maintenance and repair work

# See also

Structure (Page 15)

Exploded view of the device (Page 24)

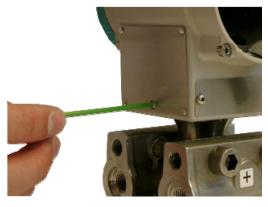

# 4.2.4.6 Replacing the measuring cell

### **Procedure**

- 1. Isolate the device from power.
- 2. Open the display cover (optional with inspection window).
- 3. Remove the display. See Section Replacing the display (Page 28).
- 4. Remove the application electronics. See Section Replacing the application electronics (Page 30).

5. Using a hexagonal socket wrench size 2.5 mm, remove the lock screws from **both sides** of the housing.

6. Turn the measuring cell clockwise by a small distance so that you can access the screws underneath the housing.

# NOTICE

# Damage to the ribbon cable

To avoid damage to the ribbon cable when installing or removing the measuring cell, do not kink, pinch, or twist it.

- Do not kink, pinch, or twist the ribbon cable.
- 8. Turn the measuring cell counter-clockwise to remove it from the housing.

1. To install the new measuring cell, carry out the same steps in the reverse order.

# See also

Structure (Page 15)

Exploded view of the device (Page 24)

# 4.3 Cleaning

# 4.3 Cleaning

# Dust layers above 5 mm

Danger of explosion in hazardous areas. Device may overheat du to dust build up.

· Remove any dust layers in excess of 5 mm.

# **NOTICE**

### Penetration of moisture into the device

Device damage.

 Make sure when carrying out cleaning and maintenance work that no moisture penetrates the inside of the device.

# Cleaning the enclosure

- Clean the outside of the enclosure and the display window using a cloth moistened with water or a mild detergent.
- Do not use aggressive cleaning agents or solvents. Plastic components or painted surfaces could be damaged.

# Electrostatic charge

Danger of explosion in hazardous areas if electrostatic charges develop, for example, when cleaning plastic enclosures with a dry cloth.

Prevent electrostatic charging in hazardous areas.

#### 4.3.1 Servicing the remote seal measuring system

The remote seal measuring system usually does not need servicing.

If the mediums are contaminated, viscous or crystallized, it could be necessary to clean the diaphragm from time to time. Use only a soft brush and a suitable solvent to remove the deposits from the diaphragm. Do not use corrosive cleaning agents. Prevent the diaphragm from getting damaged due to sharp-edged tools.

#### NOTICE

#### Improper cleaning of diaphragm

Device damage. The diaphragm can be damaged.

• Do not use sharp or hard objects to clean the diaphragm.

## 4.4 Return procedure

Enclose the bill of lading, return document and decontamination certificate in a clear plastic pouch and attach it firmly to the outside of the packaging. Any devices/replacement parts which are returned without a decontamination declaration will be cleaned at your expense before further processing. For further details refer to the operating instructions.

### 4.5 Disposal

Devices identified by this symbol may not be disposed of in the municipal waste disposal services under observance of the Directive 2002/96/EC on waste electronic and electrical equipment (WEEE).

They can be returned to the supplier within the EC or to a locally approved disposal service. Observe the specific regulations valid in your country.

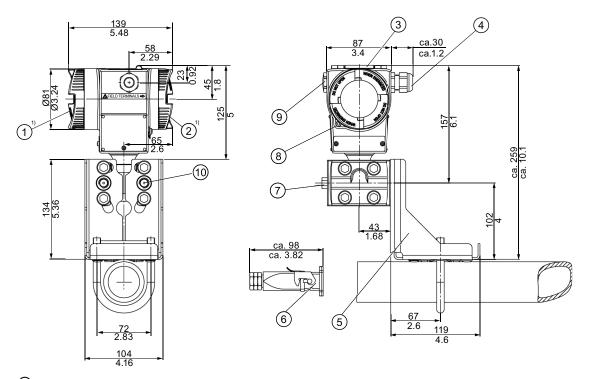

#### Note

#### Special disposal required

The device includes components that require special disposal.

 Dispose of the device properly and environmentally through a local waste disposal contractor. 4.5 Disposal

## A.3 Technical support

#### **Technical Support**

You can contact Technical Support for all IA and DT products:

- Via the Internet using the Support Request: Support request (http://www.siemens.com/automation/support-request)
- E-mail (mailto:support.automation@siemens.com)
- Phone: +49 (0) 911 895 7 222
- Fax: +49 (0) 911 895 7 223

Further information about our technical support is available on the Internet at Technical Support (http://www.siemens.com/automation/csi/service)

#### Service & Support on the Internet

In addition to our documentation, we offer a comprehensive knowledge base on the Internet at:

Services & Support (http://www.siemens.com/automation/service&support)

There you will find:

- The latest product information, FAQs, downloads, tips and tricks.
- Our newsletter with the latest information about our products.
- A Knowledge Manager to find the right documents for you.
- Our bulletin board, where users and specialists share their knowledge worldwide.
- Your local contact partner for Industry Automation and Drives Technologies in our partner database.
- Information about field service, repairs, spare parts and lots more under "Services."

#### **Additional Support**

Please contact your local Siemens representative and offices if you have any questions about the products described in this manual and do not find the right answers.

Find your contact partner at:

Partner (http://www.automation.siemens.com/partner)

Documentation for various products and systems is available at:

Instructions and manuals (http://www.siemens.com/processinstrumentation/documentation)

A.4 Repair report for installation of spare parts

## Glossary

#### **ATEX**

ATEX is an abbreviation of the French term "Atmosphère explosible" (potentially explosive atmosphere). ATEX stands for both EC directives in the area of explosion protection: ATEX product directive 94/9/EC and ATEX operating directive 1999/92/EC.

#### Auxiliary power supply

Auxiliary power supply refers to an electrical supply or reference voltage which some electrical circuits require apart from the standard supply. The auxiliary power supply can, for example, be specially stabilized, have a particular level or polarity and/or other properties which are important for the correct functioning of switch components.

#### **Auxiliary voltage**

→ Auxiliary power supply

#### Dangerous failure

Failure with the potential to bring the safety-instrumented system into a dangerous or nonfunctional status.

#### **EEPROM**

EEPROM (Electrically Erasable Programmable Read-Only Memory): a non-volatile, electronic memory module.

EEPROMs are often used where individual bytes of data (e.g. configuration data or runtime meters) change over time and must be stored safely in the event of a mains power failure.

#### Fail-safe

The capability of a control to maintain the safe state of the controlled device, e.g. machine, process, or to bring the device to a safe state even when faults/failures occur.

#### Failure/Fault

Failure:

A resource is no longer capable of executing a required function.

Fault

Undesired state of a resource indicated by the incapability of executing a required function.

#### Fault

→ Failure/Fault

#### Fault tolerance

Fault tolerance N means that a device can execute the intended task even when N faults exist. The device fails to execute the intended function in case of N+1 faults.

#### Final controlling element

Converter that converts electrical signals into mechanical or other non-electrical variables.

#### **Firmware**

Firmware (FW) is software that is embedded on a chip in electronic devices – in contrast to software which is saved on hard disks, CD-ROMs or other media. These days, firmware is mostly stored in a flash memory or EEPROM.

Firmware usually contains the elementary functions for controlling the device, as well as input and output routines.

#### Frequency shift keying

Frequency shift keying is a simple form of modulation, where the digital values 0 and 1 modulate the actual current signal by means of two different frequencies.

#### Frequency Shift Keying (FSK)

→ Frequency shift keying

#### **HART**

HART (Highway Addressable Remote Transducer) is a standardized, widely used communications system used to structure industrial fieldbusses. The communications system provides digital communications for multiple participants (field devices) via a common databus. HART is based especially on the equally widely used 4/20 mA standard for the transfer of analog sensor signals. The cabling from existing older systems can be used directly and both systems operated in parallel.

HART specifies several protocol levels in the OSI model. It facilitates the transfer of process and diagnostics data and control signals between field devices and high-level control systems. Standardized parameter sets can be used for the manufacture-independent operation of all HART devices.

Typical applications include transmitters for measuring mechanical and electrical dimensions.

#### Non-volatile memory

→ EEPROM

#### Risk

The combination of probability of a damage occurring and its magnitude.

#### Safety function

Defined function executed by a safety-instrumented system with the objective of achieving or maintaining a safe system status taking into account a defined dangerous occurrence.

Example:

Limit pressure monitoring

#### Safety Instrumented Function

→ SIF

#### Safety Integrity Level

→ S/L

#### Safety-instrumented system

A safety-instrumented system executes the safety functions that are required to achieve or maintain a safe status in a system. It consists of a sensor, logic unit/control system and final controlling element.

Example:

A safety-instrumented system is made up of a pressure transmitter, a limit signal sensor and a control valve.

#### Sensor

Converter that converts mechanical or other non-electrical variables into electrical signals.

#### **SIF**

A part/function of a safety-instrumented system that reduces the risk of a dangerous failure occurring.

#### SIL

The international standard IEC 61508 defines four discrete Safety Integrity Levels (SIL) from SIL 1 to SIL 4. Each level corresponds to the probability range for the failure of a safety function. The higher the SIL of the safety-instrumented system, the higher probability that the required safety function will work.

The achievable SIL is determined by the following safety characteristics:

- Average probability of dangerous failure of a safety function in case of demand (PFDAVG)
- Hardware fault tolerance (HFT)
- Safe failure fractions (SFF)

#### **Total error**

Total Error is sum of Total Performance and the long-term stability.

#### Total Error(s)

→ Total error

#### **Total Performance**

Total Performance is the square root of the sum of the squares of the three deviations resulting from the influence of the static pressure, the temperature and the characteristic deviation.

#### TP

→ Total Performance
